ALIGNMENTS

```
This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression
                                                                                                                                                                                                                                                                                                                           New low temperature expression chitinase gene for producing a plant grade highly resistant to psychophilic plant pathogenic microbes .
                                                                                                         Wheat; chitinase; low temperature expression; hardened; plant; snow mould resistance; psychophilic plant pathogen; rye.
                                                                                   Wheat chitinase protein homologous to rye chitinase.
                                                                                                                                                                                                                                                                             (HOKK-) HOKKAIDO NOGYO SHIKENBACHO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat PII/3438 (of high snow mould resistance). The genes are
chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat PII73438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant pathogenic microbes.
                                                                                                                                                                                                                                      240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protein
```

Secale cereale.

```
The present sequence is winter rye (Secale cereal L. cv. Muskateer)
CHT9 preprotein. The mature protein, which is also claimed, is a
chitiasse-like protein that has chitiasse (antifungal) and
antifreeze activities. CHT9 cDNA (see AAXX4889) was obtained by
isolating mRNA from rye plants grown at low temperatures in the
sheence of pathogens or other stresses, i.e. under conditions when
con partial and yeast (First) have been cloned and expressed in
chartinase-like antifreeze activity would be expressed in
The chitinase-like antifreeze proteins can be used: to increase
freezing tolerance of plants and microorganisms; to increase freed
creating tolerance of plants and microorganisms stood to sub-zero
temperatures; to inhibit ice recrystallisation in biological
materials or foods; for cryopreservation and hypothermic protection
of cells, embryos, tissues etc. (particularly human platelets); and
cot cells, embryos, tissues etc. (particularly human platelets); and
progression of diseases or spoilage caused by low temperature
cryopreserved biological material. The signal peptide can be used
cryopreserved biological material. The signal peptide can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            183

The present sequence is winter rye (Secale cereal L. cv. Muskateer)

CHT9 mature protein. It lacks the 20-amino acid signal peptide

CC of the preprotein (see AAM98079), which is also claimed. Mature CHT9

is a chitinase-like protein that has chitinase (antifungal) and

continuase-like protein that has chitinase (antifungal) and

contained by isolating mRNA from rye plants grown at low temperatures

contained by isolating mRNA from rye plants grown at low temperatures

continuated and contained contained and confidence of pathogens or cloim and ryes and microorganisms in a ratio for survival of plants, animals and microorganisms exposed to sub-zero

contensatures; to inhibit ice recrystallisation in biological

contained the more colls. They are also used to inhibit initiation and

contained theyos, tissues etc. (particularly human platelets); and

contained the more caused by low temperature

controller in materials or stocker materials.

controller funding material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              200 GPAGRAIGVDLLNNPDLVATDPTVAFKTAIWFWMTTQSNKPSCHDVITGLWTPTARDSAA 259

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence given is encoded by the rice chitinase gene. The promoter region of this gene (see AAQ11407) is responsive to physical and/or biological stress. The pattern of expression of this protein in mature plants is characteristic. There is a low level of expression in autre laves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant defence genes and selectable genes.

The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Brill protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance genes referred to as RKK genes. When Xa21 is present in a transgenic plant, it confers resistance to Xanthomonas spp.. The plant receptors containing heterologous domains are useful for modulating plant receptors to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to
                                                                                                                                                                                                                                                                                                                                                                           Disease resistance protein; Xa21; RKK gene; transgenic plant; chitinase; Xanthomonas; plant pathogen; Bril protein; RCH10 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric plant receptors comprising a polynucleotide encoding a RRK receptor containing a heterologous extracellular domain and a kinase domain from a Xa21 polypeptide, useful for modulating plant responses

                                                                                                            This sequence represents an intracellular chitinase which is used to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-glucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes exhibit a synergistic antifungal effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   245 VITGLWIPTARDSAAGRVPGYGVITNVINGGIECGMGQNDKVADRIGFYKRYCDIFGIGY 304

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δy
                                                                                                                                                                                                                                                                                                                                               2;
                                                                                                                                                                                                           The present sequence represents an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1, 3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungi. The recombinant polynucleotides and the process are useful for producing fungal resistant plants.
                                                                                                                                              New transgenic plants expressing chitinase and glucanase have improved resistance against pathogenic fungi, particularly against Alternaria alternata or Fusarium oxysporum f. sp. lycopersici

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Attachment of the signal peptide ensures occlusion of expressed prod. in the vacuole while elimination of the signal peptide from a sequence normally contg. it ensures that the expressed product is secreted into the extracellular space, rather than retained in the vacuole. Recombinant DNA may contain a structural gene which protects the plant, e.g. resistance to pathogens, herbicides, insecticides, blocides, environmental stress, etc.; leads to increased produ. of proteins, carbohydrates, etc.; leads to pharmaceuticals such as hormones or immunommodulators.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the pumpkin chitinase. Chitinase is an enzyme decomposing chitin (not present in plant cell membranes) found in the cell membranes of fund; plants have this enzyme to protect themselves from pathogenic fund; Thus this enzyme can be used to prevent plants from being infected with pathogenic fungi, and the chitinase gene can be fundi. As the amino acid sequence of the chitinase does not have any region to be cleaved by ubiquitous peptidases in cells, the chitinase and serves for prants combination technology works for various host cells and serves for plant immunity to confer disease resistance on plants as the host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5

A fragment (claimed) from the 5.-untranslated region can be used to increase the expression of foreign genes in transgenic plants. The fragment is linked to a foreign gene, eg chitinase or glucanase gene via a spacer and is also linked to regulatory sequences. The resultant DNA construct is used to transform plant cells, eg tomato, or tobacco, which subsequently produce the gene prod.

This protein inhibits the fungus Ophiostoma ulmi, the causative agent of dutch elm disease. The clone pHS2 may be used to transform E. coli cells for the recombinant production of the chitinase-like protein. The protein may be used in a composition to inhibit fungal infection of elm trees.

```

```
The inventors claim a new recombinant gene which codes for a protein with encochitinase activity, or its precursor (see AAQ21007). The coding part of the gene contains at least the 5' part of DNA for tomato enzyme (DNA can be genomic or cDNA, but at least one intron is prefigresent). The recombinant gene includes the 35s promoter of cauliflower mosaic virus plus the terminator from the nopaline synthase gene of Agrobacterium tumefaciens.
                                                                                       Pest-resistant plant; transformed plant; fungi; insect; bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant protein with endo chitinase activity - also DNA encoding it and plants which express it, resistant to fungi, insects, bacteria and nematodes.
                                                                                                                                                                                                                                                                                                                                                     Toppan A;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 3, Ag

T07838
chitinase (EC 3.2.1.14) - cucurbit
C; Species: Cucurbita sp. (cucurbit)
C; Date: 14-May-1999 #text_change 20-Jun-2000
C; Date: 14-May-1999 #sequence_revision 14-May-1999 #text_change 20-Jun-2000
C; Accession: T07838
R; Baaka, M.
Submitted to the EMBL Data Library, June 1998
A; Accession: T07838
A; Accession: T07838
A; Accession: T07838
A; Molecule type: mRNA
A; Residues: 1-31 cESA>
A; Cross references: EMBL:AB015655; PIDN:BAA31131.1
C; Genetics:
A; Gene: chitpl
C; Superfamily: lectin-related plant chitinase; hevein chitin-binding domain homology; pl
C; Keywords: q14pcosidase; hydrolase; polysaccharide degradation
C; Keywords: q14pcosidase; hydrolase; polysaccharide degradation
F; 20-61/Pommain: hevein chitin-binding domain homology <PCH>
F; 75-311/Domain: plant chitinase homology <PCH>
